UTM2 SOFTWARE (UNIVERSAL TESTING MACHINE 2)

Software developed by Matest allowing operators the management and a "User friendly" control of Matest's digital testing machines.

Software available in different languages
(Italian, English, French, Spanish, German, Polish, Czech, Slovak, Turkish)

The optimal solution of laboratories for its characteristics of versatility with a wide range of customizations, for testing and research.

The ideal Software for the management of an extensive production. It contains preset profile tests according to the specifications of the EN Standards and the most common International Standards.

Flexibility, operating speed, precision and automatic storage are the fundamental characteristics of the Software conceived to facilitate the operator with few computer skills, for the management of the tests and the testing machines too.

By connecting the PC to the testing machine it is possible to perform the most complex tests just by pressing the start button. UTM2 requires a low expertise operators without any specific experience to use the software successfully (with low cost for the company).

It facilitates the printing of certificates suggesting a preset layout but changeable and customizable by the user with its own logo or others.

The software is developed on Windows platform and can be installed on old and new operative systems such as windows 2000, XP, Vista, Windows 7.

Section A
AGGREGATES - ROCKS

Aggregates represent the mainly used product in the building industry; they are used in concrete, bituminous conglomerates, plasters, road and railways subgrades... etc.
The different International Standards together with the EN European Standards are requiring many different checks on different features as: mechanical, physical, geometrical, kind of density, strength, degradability, etc.

A rock stratum will undergo alterations in the mechanical characteristics when it is exposed to excavations, handlings etc.
For above reasons a study of the mechanical characteristics of an intact rock becomes indispensable in order to analyse the relative characteristics when realising underground or surface structures as galleries, quarries and foundations.

LABORATORY DRYING OVENS

Two versions available:

- **Natural convection for general purposes**
- **Forced ventilation for a more uniform temperature with on/off switch of the fan** NEW

Designed for drying, baking, conditioning and moisture determination.
Sturdy manufacture, double walled with 60 mm thick glass fibre for thermal insulation.
Exterior front part is stainless steel made; while interior chamber, grid shelves and external walls are made from zinc coated steel.
Temperature from ambient to 200°C. is controlled by a **"digital thermoregulator-indicator"**. The ovens are equipped of a **"dual safety thermostat"** with higher thermic threshold to prevent accidental over-temperatures, and to ensure safe working conditions.
The oven is supplied complete with two grid shelves easily removable and that can be positioned at various heights, pilot light, exhaust holes for fast cooling.

Air Jet Sieving Machine

STANDARD: **EN 933-10**

The Air Jet Machine is suitable for sieving powder and dry grain products by obtaining sieving results between 5 to 4000 microns, by using appropriate test sieves 200 mm dia. Its working foundation is based on the use of air that tug thin particles to make them go through the sieve.
This effect is made through a vacuum machine that provokes a controlled decrease of pressure. This vacuum machine is equipped with an automatic cleaning system of the filter cartridge allowing **to perform many tests** (some tens) before being replaced.
The digital electronic microprocessor panel can adjust:
- The sieving time from 0 to 99 minutes
- The vacuum range from 0 to 65 mbar
- The calibration function

The unit is supplied complete with aspirator device, plexiglass cover, filter cartridge, 5 collecting plastic bags, accessories.
Power supply: 230V 1ph 50/60 Hz
Dimensions: 450 x 600 x 400 mm

Electromagnetic sieve shakers

STANDARDS: **EN 932-5 /** ISO 3310-1

These Sieve Shakers are activated by electromagnetic impulses and thanks to the triple vibrating action (vertical, lateral and rotational) they are recommended to perform sieving tests where high precision and performance are important, and where continual and intense uses are required. They are therefore suggested for accurate sieving tests, also on fine materials.
These Electromagnetic Shakers are of simple and sturdy construction, can hold up to 10 sieves and they are also suitable for wet sieving tests (accessory mod. A046, A047).

The separate digital control panel can adjust:
- The sieving time from 1 to 999 minutes
- The vibrating intensity
- The pauses between one vibration and the following one (this is especially indicated for fine material sieving).
  Power supply: 230 V 50Hz 1ph 450/750W

NEW

It measures the resistance of road aggregates, paving stones, paving blocks, to the polishing action of vehicle tyres on a road surface.
The specimens are manufactured with suitable moulds.
The specimen is than located on the Road Wheel accepting 14 specimens.
The wheel is now rotated and enters in contact with solid rubber tyre, spring loaded.
Abrasive charges are continuously introduced by two automatic mechanical feeders (hoppers).
The feeders are held by a suitable support disjoined from the machine body; this solution saveguards feeding calibration and realiability/life of the hoppers from the influence of test execution vibrations.
Road wheel speed: 310 to 330 r.p.m.
The water is supplied at a controlled rate through a water container equipped with flow regulator.
The digital control panel, foreseen in the back side of the machine, allows to select the test time.
During the test execution the display shows the remaining time and the speed rotation of the wheel holding the specimens.
The machine provides a method of preparing polished stone specimens for use with the Skid Resistance Tester mod. A113 when used in Laboratory.
The unit is supplied complete with 2 rubber wheels (one for corn and one for flour emery), set of 4 secimen moulds and 2 mould covers, while control stone, corn and flour emery have to be ordered separately (see accessories).

ELASTIC MODULUS of rock specimens in uniaxial and triaxial tests

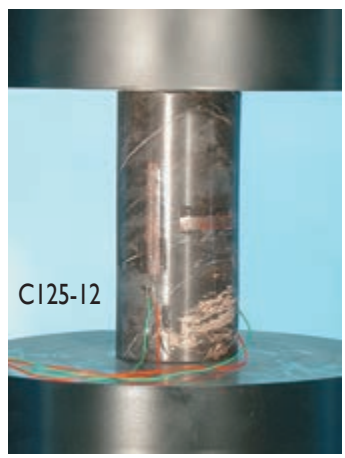
System:
Automatic with pace rate control also when releasing the load.

STANDARDS: ASTM D7012 / UNI 9724-8 / ISRM UNE 22950-3

It can be used with a MATEST high stability frame with capacity of, 2000, or 3000 kN coupled to the Automatic Servo-controlled system "Servo-Plus Evolution" (mod. C104N).

The appliance includes:

- Hydraulic system
  It is an hydraulic installation and has a high performance valve directly controlled by the digital unit that grants the automatic control of the pace rate increasing the load, keeps a certain load and than controls the pace rate decreasing the load.
  The setting of the pace rate is made by a very sensitive valve controlled by a step by step motor that allows a micrometric action on the pace rate granting excellent results in the control of the load.
  A laser position detector allows a rapid positioning of the piston and a very accurate touch point. This grants a touching sensitivity of test starting of about 0.1 per thousand of the maximum capacity.
  When used in conjunction with the C104NLP (see page 66) for the application of the side pressure, the hydraulic system permits to maintain the pre-load level with extremely high accuracy.



C125-12

C134

- Electronic measuring system
  The high performance control and data processing unit controlled by a 32 bit microprocessor, can manage up to 8 high resolution channels for the control of load cells or transducers with strain gages bridge.
  The unit contains two Analogical/Digital last generation converters with 24 bits resolution. The system processes the signals coming from the load cells and from the extensometers giving all the results required for a further processing following the most updated standards for this application.

- **Data acquisition and processing software UTM2 (Universal Testing machine 2) with License for Elastic Modulus on Rocks.**
  The software has been developed on the working line of the already known software UTM-2 (windows menu). It contains the profiles of the main Standards used, but the user can modify as he likes and personalise the test profile, that will be effected in a completely automatic way by the testing machine.

The user must introduce a list of dates concerning the specimen that will be tested and the kind of test that he wants to make: shape of the specimen (cylinder-cube-block), dimensions, age of the specimen, average expected breaking value, etc… The appliance allows verifying the proper reading of the extensometers and, if everything is within the expected tolerances, it manages the average deformation value read by the transducers and processed by the digital unit, than it transmits by means of the serial communication port RJ45 (Network Connection) to a Personal Computer, that can be already by the end user or supplied separately (not included with the Software), all the dates of the test. These dates will be processed by the software and transformed in a graph load/deformation and load/time, following the specific Standards.

The software gives the possibility to print on a standard printer a test certificate reporting all the dates concerning the test and the specimen and the graph of the test. The software includes the license "Servonet" mod. C123N. The extensometers (proposed in two versions: **A** and **B**) are not included in the supply and must be ordered separately (see accessories).

TRIAXIAL TESTS ON ROCK SPECIMENS

STANDARDS: ASTM D7012 / **EN 1926, EN 14580**

The triaxial test is made on a rock specimen placed into a container (Hoek cell), closed into a latex membrane .
The specimen receives an axial load and a constant isotropic pressure normally between 5 and 6 Mpa for the whole test.

The electric extensometers are directly applied on the surface of the rock specimen and they are used for the automatic reading in real time of the different parameters and find different information as:

Radial deformation combined with the axial deformation to obtain the Poisson value.
Stress value in relation with the axial and radial deformation.
The maximum or breaking value.
Tangent and secant Young's modulus measured on the axial deformation curve.
Maximum stress value in triaxial conditions.

The standards require that during the compression test the load on the rock specimen is applied in a continue way in order to obtain the breaking of the specimen within a time included between 5 and 10 minutes, with a constant increase of the load included between 0,5 and 1,0 Mpa/second.

For this reason it is recommended the use of a compression load frame with capacity of 1500, 2000 or 3000 kN (see concrete sector) combined with the automatic servo-controlled system "Servo-Plus Evolution" model C104N and to the automatic system for the Elastic Modulus on rocks model A150N, that includes the data acquisition and processing software.

The side pressure set by the user, is kept constant between ± 1% using:

C104N LP
Automatic servo-controlled system "Servo-Plus Evolution" that grants a setting of the pressure up to 70 Mpa.

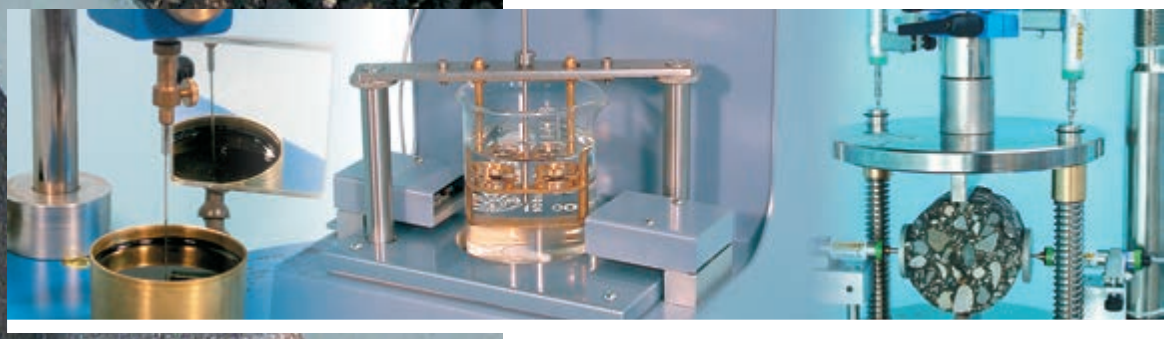
Section B
BITUMEN - ASPHALT

The use of bituminous materials is mainly addressed to roads construction.

The asphalt, named also bitumen, is mainly composed by aggregates and binder, with an infinite variation of mixtures.

It is therefore necessary to get suitable equipment to perform different test methods and to determine: binder content, internal friction, cohesion, consistency, softening point, viscosity, quality of aggregates, voids percentage, levels of compaction, stiffness modulus, fatigue resistance, Marshall test, and many other parameters.

The equipments described in this Section largely satisfy all these test procedures, conform to the new EN Standards on road materials tests, and replace those previous national Standards.



B005

Bitumen content furnace by ignition method

STANDARDS: **EN 12697-39** / ASTM D6307 / AASHTO TP53 / NCAT (National Centre for Asphalt Technology) / BS (DD)

B005

The unit provides asphalt content of bituminous paving mixtures accurate to 0.11%, with a fast, accurate, environmentally friendly, and cost effective method of determining asphalt content.
Ignition method reduces testing time when compared to solvent extraction. A 1200-1800 gram sample of asphalt can be tested in 30-45 minutes using this Content Furnace.
Unit can accommodate samples up to 5000 grams!
MATEST Furnace has an internal scale, that automatically monitors the sample weight throughout the ignition process, saving valuable technician time and increasing productivity in the lab.
The ignition method replaces the costly and time consuming solvent extraction method by eliminating the primary cost of solvent purchase and the secondary cost of solvent disposal.
MATEST Content Furnace eliminates the exposure of the asphalt technician to harmful solvents. The automatic door-lock feature prevents opening the chamber door during the critical test time. This feature provides operator safety and helps ensure testing integrity. This Content Furnace is the only system on the market containing a high temperature afterburner used in conjunction with a patented ceramic filter to reduce the emissions of the ignition process by up to 95%. Our System has the capability to accept positive or negative correction factors for use with mixes containing hydrated lime. This unique furnace automatically detects endpoint within .01% of the sample weight. Furnace software allows you to choose between automatic and manual test mode. In the automatic mode, the endpoint is detected; the software ends the test, prints out the results and beeps. In the manual mode, the endpoint is detected; the unit begins to beep but will continue to test until the user presses "stop" to end it. Once the "stop" button has been pressed, the door will unlock and the results will be printed.
Furnace software automatically compensates for weight change due to sample and basket assembly temperature change. This compensation is computed for each sample load tested, unlike competitive models that assign a fixed number to a given range of load sizes.
The Furnace is supplied complete with 4 basktes, 2 trays, 2 covers, handle, cooling cage, insulated plate, gloves, face shield, 4 rolls of printer tape.

ASPHALT SPLITTER

NEW

This instrument is used to break and crumble asphalt samples to facilitate bulk density tests and laboratory testing purposes, by reducing the granulating time in few minutes with high quality results.
A rough asphalt sample of approx. 1 kg is poured into the stainless steel bowl equipped, at its bottom, of three rotating paddles.
The cover is closed, the machine started, and the three paddles break and crumble the sample in grains.
One to three minutes are normally sufficient to obtain a grained sample, but the longer is the grinding time, the more grain sizes will decrease.
The bowl is now tilted to discharge the sample into the self supporting suitable pan supplied with.
A hinged cabinet reducing noise protects the bowl. When opening the cover while the splitter is working, a microswitch automatically stops the machine, conforming to CE Safety Directive.

TECHNICAL SPECIFICATIONS:

- Stainless steel bowl 6 litres capacity
- Multirange timer: sec/min/hour
- Main switch, Start/Stop button
- Switch for reverse mode of the rotating paddles (very useful when the material restrains between paddle/bowl)
- Paddles speed: 1400 rpm
- Power supply: 230V 50Hz 1500W

Moisture Induced Stress Tester

STANDARD: ASTM D7870

Proper testing and screening of Hot Mix Asphalt (HMA) mixes for moisture susceptibility is a crucial requirement for designing today's high-performing, longer-lasting pavements. This product is designed to simulate HMA pavement asphalt stripping mechanisms, which are due to water and repeated traffic loading. Current moisture sensitivity tests suffer from poor repeatability and test times can take up to seven days. HMA conditioning in the instrument is automatic and can be completed in less than a day.
Plug the unit into a standard wall outlet, place the sample in the chamber, select your settings and the unit does the rest. The device creates pressure cycles within the chamber to simulate the effect of moisture on the asphalt mixture. The data from the unit can be stored and transferred to a PC for evaluation and storage.
Temperature Accuracy: ±1 °C
Pressure Accuracy: 0.25%
Power supply: 230V 1ph 50Hz 1650W

GYROTRONIC - Superpave Gyratory Compactor, Matest made

NEW

STANDARDS: **EN 12697-10, EN 12697-31** / ASTM D6925 / AASHTO T312 / SHRP M-002

This Gyratory Compactor, entirely developed and manufactured by Matest, is used to simulate and reproduce the real compaction conditions under actual road paving operations, hence determining the compaction properties of the asphalt.
Such compaction is achieved in a fully automatic way, by combining the rotary action and the vertical resultant force applied by a mechanical head.
The Compactor comprises a highly rigid steel frame ensuring excellent angle control.
Load is applied by an electro-pneumatic cylinder, servo-controlled by a precision pressure regulator; the height is measured by a linear transducer.
Gyratory motion is generated by an eccentric high precision system allowing an easy set up with precision and constant angle of gyration.
The rotation speed is controlled by an inverter through on board computer control.
Using the proper perforated mould, the Compactor is able to run tests also on cold emulsified asphalt mix.
The acquired results are also employed in the investigation of volumetric and mechanical characteristics of the asphalt mix.
The machine is calibrated at Matest factory with the internal angle set according to the Standard chosen by the customer:

- **Angle set to 1,16° to meet ASTM D6925, AASHTO T312, SHRP M-002**
- **Angle set to 0,82° to meet EN 12697-10, EN 12697-31**

Gyratory compactor with shear stress measurement device

This model is basically structured as mod. B041 and B041EN, but, in addition, **"it includes the shear stress measurement device"** and therefore it is recommended for both design and research purposes.

MAIN FEATURES:
- The device provides the most important parameters required to determine the main properties of asphalt mixes, and to predict their suitability for practical uses.
- Useful for research purposes and experimental studies, and increasingly being considered as a "needed accessory" in most of the worldwide markets.
- A group of load cells (integrated into the Gyratory Compactor's frame) measure all the involved forces acting on the specimen, which are analyzed by the software in order to calculate the effective shear stress value.
- Real time visualization of the instant shear stress value along the entire compaction process.
- Calculation of the resultant load's eccentricity and consequently the effective tilting moment.
- Possibility to export the results into an Excel data report, which can be easily edited by the operator.

ADVANTAGES:
- The shear stress measurement device is integrated into the Gyratory Compactor and therefore it doesn't require any additional operation to be done by the user.
- The system comes already calibrated from the factory.
- Available either with ASTM configuration (internal angle: 1,16°) or EN configuration (internal angle: 0,82°).

Some asphalt mixes can be very unstable due to their high void ratio and large particle size. Wrapping the sample around the hollow punch will prevent it from crumbling down or receiving physical deformations once it is ejected from the mould.
The material will then settle down and assume its stiff properties once it cools down after compaction:

GAM - Gyratory internal Angle Measurer

STANDARDS: **EN 12697-31** / ASTM D7115 / AASHTO T344

NEW

This Gyratory Angle Measurer has been designed by MATEST to provide an angle validating device which can be used by the operator to carry on the calibration of the Gyratory Compactor.

The device perfectly simulates a HMA specimen as it generates an equivalent tilting moment and shear forces.

GAM can cover a wide range of angles, including the ones specified by EN and ASTM Standards.

The device allows to perform TOP and BOTTOM angle measurements as specified by the Standards; the average of the obtained values is then considered as the "internal angle of the machine".

An excel spreadsheet, which is supplied along with the device, is used for data acquisition and processing, and provides the precise value of the internal angle according to the calculation procedure specified by EN 12697-31 (Annex-C) and AASHTO T344.

The spreadsheet allows to plot several graphs showing the measured data and it also provides some important indexes about the quality of the data.

MAIN FEATURES:

- High accuracy of the measured data
- The device is supplied complete with:
  - Two different rings to perform tests either with M=240Nm or M=425Nm
  - Upper and lower base plate
  - RS232 cable
  - Strong practical suitcase
  - Calibration certificate
- Data are read by GAM and then downloaded (via RS232 cable) all together at the end of the measurements, with no need to connect the device to the PC after each measurement
- Possibility to repeat even just one of the measurement, and lately include it in the calculation spreadsheet
- Data processing is carried out by a specific spreadsheet, which also allows to create the final calibration certificate
- No need for power supply since the device is battery operated. Also it has an energy saving feature which automatically switch off the device if it is not being used for a while.

ASC - Asphalt Shear box Compactor

Asphalt technologists are acutely aware of the importance of a representative specimen during any laboratory performance testing.
The precise shearing motion of the ASC replicates the conditions of field compaction in order to reproduce the field properties of asphalt, quickly and easily under the controlled conditions of a laboratory.
The ASC compacts large asphalt prisms that can be sawn to produce four to six beams or slabs for laboratory wheel tracking; or the prism can be cored to produce three to four 100mm diameter cylinders, all having essentially identical properties.
The electronic control unit with touch screen color display operates like a standard Windows based PC for the management and analysis of the data, test results and graphs.
The user friendly touch-screen icon interface allows for easy set up parameter entry, enables immediate (fully automatic test execution) data acquisition/processing, test report, and data file generation.
A LAN connection to Intranet/Internet enables remote communication to receive immediate diagnostic analysis and technical support from Matest technicians, and/or software updates.

Pavetest, a new division of Matest

Pavetest is the new division of Matest committed to developing innovative, dynamic testing systems for asphalt.
Whilst Pavetest Pty. Ltd. may be a new player in this growing market sector, they are certainly not lacking experience. With many years of experience in developing pavement testing systems between them, Con Sinadinos (Managing Director) and Alan Feeley (Technical Director) bring a wealth of experience and talent to the company. The benefit is evident in every aspect of every product, which are designed to perform, built to last and easy to use.
From its inception, Pavetest's aim is to develop a range of **testing systems with unparalleled performance, ultimate versatility and exceptional reliability, at a price that represents real value for money.**
Pavetest's range of pavement testing systems both complements and completes Matest's Asphalt and Bitumen business unit.

CDAS - Control and Data Acquisition System

Pavetest's compact Control and Data Acquisition System (CDAS) delivers unparalleled performance, real time control and ultimate versatility in acquisition.

TestLab Software

Developed with ultimate flexibility in mind, TestLab test and control software caters to all levels of operator experience. By using pre-programmed **"Method files",** an inexperienced operator can run a range of international test methods without the need for any programming.
Moreover, a test **"Wizard"**, available with popular tests, can guide the operator step by step based on a "recipe book" approach.
Most importantly, the experienced engineer and/or researcher need not be constrained by the functions and analysis in the method files provided. The operator may clone, modify and/or generate his/her own method file to suit their specific requirements. The Excel based data analysis offers the operator the flexibility to implement alternative analysis and customize reporting facilities.
TestLab allows for real time graphing of results and configurable real time transducer levels display with unprecedented clarity of results and analytical power.

TestLab software is included with CDAS - Control and Data Acquisition System. It is supplied on CD that also includes the relevant Method files (based on the test configurations supplied) and calibration files for all transducers supplied.

30 kN SERVO-HYDRAULIC DYNAMIC TESTING SYSTEM (DTS-30)

The DTS-30 Dynamic Testing System is a servo-hydraulic testing machine utilizing digital control of a high performance servo valve to provide accurate loading wave shapes up to 100 Hz. The DTS-30 can be operated in tension, compression dynamic loading and is suited to testing a diverse range of materials such as asphalt, soil, unbound granular materials, fibres and plastics.
The DTS-30 is underpinned by Pavetest's leading edge CDAS digital controller, TestLab software and a full complement of accessories, hardware and software in perfect unison.
The DTS-30 Dynamic Testing System is compact, fully integrated, user and environmentally friendly.

The machine includes:
- 150 kN Load frame
- 30 kN Servo-hydraulic actuator (100 mm Stroke)
- 2.2 kW Hydraulic Power Supply
- 16 Channel Control and Data Acquisition System (CDAS) & TestLab software (see page 104)
- Load cell (± 30 kN)
- 100 mm actuator LVDT

MAIN FEATURES:

- **Compact, robust (150 kN) load frame**
- Small footprint; 90 cm x 135 cm, including hydraulic power supply and climatic chamber
- **Reaction frame embedded in the test chamber**
- **Portable temperature control unit**
- **Fully configurable** to suit a large range of testing applications
- Digital Servo-Hydraulic control
- 4 axis control and 16 channel data acquisition as standard

ADVANTAGES:

- **The DTS-30 fatigue rated, servo-hydraulic actuator utilizes metal labyrinth bearings and seals.**
  The labyrinth bearings and seals are designed to reduce friction and maintain low operating temperatures.
  The bearings experience little-to-no wear, operate at high speeds and offer a long service life.
- **The speed of the HPS pump motor is controlled using a variable-frequency drive (VFD), or inverter drive.**
  This enables the motor to be slowed down, or turned off, when the oil flow from the pump exceeds the flow required by the actuator at any given time. This not only reduces noise and heat generation but also offers cost savings, by reducing power consumption. Furthermore, the HPS can operate at 50 Hz or 60 Hz.

WHAT MAKES IT DIFFERENT MAKES IT BETTER!

The DTS-30 is Universal Testing Machine (UTM), but not as most people know it. It does not conform to the "me too" attitude of most UTM manufacturers. The innovations featured on the DTS-30 are built on many years of experience, developing, studying and using various universal testing machines from a number of manufacturers.

The first thing you will notice about the DTS-30 is the absence of a reaction frame. **The reaction frame** most certainly exists, but it's **embedded in the test chamber**. This provides a very sleek appearance, maximizes the space inside whilst reducing the space required outside.

Since it is mandatory to control the test temperature of most pavement materials, e.g. asphalt, **the test chamber is insulated and forms part of the temperature controlled cabinet**.

Most UTM manufacturers opt for an elaborate (and expensive) moveable crosshead, only to find that its range (and usefulness) is limited by the climatic chamber.

The DTS-30 has a remotely positioned reaction shaft that adjusts the work space. However, you won't need to adjust it often because the **servo-hydraulic actuator has 100 mm of stroke**.

B230 DTS-30 Dynamic Testing System, open

PORTABLE TEMPERATURE CONTROL UNIT

The temperature control unit attaches to the test chamber using a magnetic seal and can be wheeled away when not required or for servicing.

This also makes servicing, replacing or upgrading the temperature control unit virtually effortless: it can be removed without dismantling the machine or disrupting the testing program.

A BOTTOM LOADING MACHINE

Before this current crop of universal testing machines, many dynamic testing machines were bottom loading.

More recently, the Asphalt Mixture Performance Tester (AMPT) changed the mindset of the testing community by highlighting the benefits of a bottom loading machine.

Firstly, **it is a neat, compact and integrated solution**, that places all hydraulic components within easy reach: gone are the long hydraulic hoses that run up and down the side of the machine and got in the way. They have been replaced by **shorter hoses that connect the actuator to the hydraulic power supply** that's tucked neatly away behind the machine, under the test chamber.

Can't see the **Control and Data Acquisition System (CDAS)?** That's because **it's housed neatly, in the cabinet in front of the machine**.

You won't see a tangle of cables either; they enter the cabinet through the floor of the test chamber or through the back of the cabinet and connect to the CDAS.

The door of the cabinet can be held ajar to allow transducers to be re-allocated or opened completely for servicing. Unused transducers can also be stored out of harm's way.

Moreover, the DTS-30 reaction frame is symmetrical; **the servo-hydraulic actuator and reaction shaft can be interchanged to make the DTS-30 top loading**.

UNITRONIC 200kN "Matest made"

UNIVERSAL ELECTROMECHANICAL FRAME, 200KN CAPACITY, "TOUCH-SCREEN" FOR:
- COMPRESSION
- FLEXURE
- TENSILE

TESTS OF CONSTRUCTION MATERIALS WITH SERVO-CONTROLLED SYSTEM OF LOAD OR DISPLACEMENT/STRAIN.

Unitronic 200kN is the universal and versatile machine fully satisfying the needs of control, research and university laboratories to carry out tests on:
Roads (Marshall, Duriez, CBR etc.), Steel, Concrete, Cement, Wood, Plastic, etc.
The machine is composed by a sturdy base containing the transmission components and the hardware control instruments.
The base holds two columns, made of high resistance steel with ground hard chrome surfacing.
The upper crosshead can be adjusted in height, to hold the accessories to perform the specific tests.
The lower mobile crosshead is operated by a recirculating ball screw and rotating lead, that through a servo-controlled motor, assures the correct application of load and constant speed.
The load is applied by a mechanical jack activated by a **"brushless closed-loop motor with optical encoder"** controlled by a microprocessor.
The two crossheads foresee couplings to fix the different test devices (see accessories).
The stress is measured by an electric load cell; the measurement and the displacement control of the crosshead is achieved by the electronic device incorporated into the machine.
Stroke electric end excursion switches of the upper mobile crosshead are foreseen to save the machine from accidental handlings.

Firmware:
- Electronic control unit "Cyber-plus Evolution" with Touch-Screen colour display, that runs like a standard PC based on Windows operating system for the management and analysis of the data, test results, graphs.
- The Touch-Screen icon interface allows an easy set up of the parameters and immediate execution of the test.
- The machine can be connected to a PC for remote test execution through suitable Software; the machine can in any case perform the tests without any external PC, because of the "Cyber-Plus" grants performances like a PC.
- Direct connection to Intranet (connection to a LAN network) and Internet to establish a remote communication and receive an immediate diagnostic analysis from Matest technicians, or for uptdates of the software.
- Unlimited memory storage with: 2 USB ports, 1 SD card slot, RS232/485 serial port.
- Possibility to select different languages.
- Hardware technical details: see pag. 24

Asphalt samples sealing device

STANDARDS: ASTM D6752 / ASTM D6857 / ASTM D7063 / AASHTO T-331

The device is a system for sealing samples for determination of bulk specific gravity (density) of compacted and loose asphalt mixtures. The system can also be used for determination of bulk specific gravity and absorption of aggregate and stone. This product is now the standard for measurement of bulk specific gravity of open graded and absorptive compacted asphalt samples.

Asphalt samples vacuum drying device

STANDARDS: ASTM D7227 / AASHTO PP75

The device is a vacuum drying device specifically designed for rapid drying of compacted asphalt cores and samples. The quick and accurate dry weight, helps contractors determine pavement density close to real time and make adjustments to rolling pattern and material if necessary. It can also provide a matching baseline for density comparison between contractors and agencies.
The device dries specimens near room temperature, ensuring sample integrity and the most accurate & repeatable dry weight. Rapid moisture loss is attributed to electronic desiccation and high vacuum technologies. The system cycles a flow of ambient air and vacuum, ensuring a highly efficient moisture removal process. The state-of-the-art and patented thermoelectric cold trap is specifically designed to protect the vacuum pump from damage by capturing moisture extracted from the sample.

Section C CONCRETE

The accurate and satisfactory test of fresh and hardened concrete are essential elements for any type of building realization. The final quality of the concrete utilized in the structure depends from many variables like: workability, consistency, setting, time, volumic mass, air content, compressive strength, temperature, linear variations, etc.

Matest proposes a complete range of testing and research equipment on concrete to satisfy practically all the above quality variables, in compliance with the EN, ASTM and the most known International Standards. In the second part of this section a complete range of instruments is available for non-destructive tests, to investigate and evaluate the progressive ageing and durability of concrete structures submitted to the chemical attacks, air pollution, time.

COMPRESSION AND FLEXURAL TESTING MACHINES

In the Concrete section we are in the position to supply the widest and most complete range of compression and flexural testing machines today available in the worldwide market, making Matest the leader manufacturer of testing machines.
The versatility and flexibility of Matest testing machines production range allow the enduser to select and combine compression/flexural groups in order to satisfy and to personalize any specific requirement.

GENERAL DESCRIPTION
The load frame is extremely strong and oversized to grant high rigidity and stability.
The upper head holds the precision lapped ball-seating and the compression platen.
Compression platens are surface hardened over 55 HRC and ground.
Design emphasis has been placed on simplicity both of construction and operation so that our machines are rugged, easy to use and maintain, and designed for heavy continue use.
They are designed to conform to International Specifications as: EN, ASTM, AASHTO, BS, NF, DIN, UNI, UNE.
They are available in 1300 kN, 1500 kN, 2000 kN, 3000 kN, 4000 kN, 5000 kN capacity, both hand-operated and motorized, at one or two gauges, with electronic digital display measuring system, and with automatic servocontrolled console with microprocessor.
The different versions give the possibility to test cubes, cylinders, blocks. All the machines can be equipped with safety guards.

Hydraulic system

Piston has large diameter: this allows the hydraulic circuit to work at low pressure with longer life of the working components and higher precision in the results.
Piston is ground and lapped, and a high quality packing set of three elements is utilized.
Motorized models foresee a dial device to visualize, pre-select and control the flow allowing an uniform load rate as requested by the Standards.
A fast approach ram action device is foreseen to avoid dead times during the stroke of the ram.
Power pump is multipiston, assuring continuity of delivery.
A movement indicator visualizes instant by instant the piston's excursion during the compression test.

A hopper covering the piston is conceived to avoid the powder of the broken specimen to enter into the cylinder of the press damaging the packing set.

LOAD MEASUREMENT SYSTEMS

A) GAUGES

The gauges are Bourdon tube type. They are foreseen of max. load pointer, zero adjustment and mirror face to avoid parallax errors.
Low pressure gauge is fully protected from overload by a pressure control device.

Configuration of advanced parameters through tests on real samples

Valid for all MATEST testing machines equipped with SERVOPLUS/CYBERPLUS controlling unit. When ordered, the setting of the advanced parameters becomes a phase of the production process. Through tests on real samples, it's possible to define in details the behavior of the tested material and therefore set into the SERVOPLUS/CYBERPLUS controlling units advanced parameters accordingly. For the setting of the advanced parameters, it's necessary to have some real samples available at MATEST's premises.

COMPRESSION TESTING MACHINES "TESTED FOR HIGH STABILITY", FOUR COLUMNS PRESTRESSED FRAME

The compression machines **"tested for high stability"** meet the stringent requirements of the:
EN 12390-4 / BS 1881:115 / DIN 51220. / UNI 6686, part 3 / NF P18-411 / UNE 83304 / ASTM C39 / AASHTO T22
The machines are manufactured with specific quality features (processing, tolerances) of frame, piston/cylinder group, spherical seat, compression platens, distance pieces etc., conforming and meeting the high stability verification. (force distribution).
The conformity of the stability is certified with the verification of the self-alignment (foot-meter test) of the machines's components and the restraint on movement of the upper spherical seat/platen, by using a special electric strain load column at 5 measuring points which is connected to its suitable datalogger (technical details: see pag. 251)

An incorrect and not uniform load application to the specimen causes irregular, unsatisfactory and premature failure. The obtained compression resistance can be substantially lower than the effective resistance.

The most important feature of the "high stability frames" is their uniform distribution of the applied load on all the specimen's surface under test. The sample breakage is satisfactory and the strength results are correct, high and true.

- The four columns frame is prestressed on 8 ring nuts and the clamping is obtained and checked by a dynamometric spanner, allowing to get a very high stiffness and stability on all load range and to keep these features in the time.
- The spherical seat, in oil bath with null end float, is studied and manufactured to grant, during the starting phase of the test, an accurate self-alignment without frictions of the upper compression platen to the specimen. By applying the load, the ball seating assembly locks and keeps the position until the specimen's failure.
- Piston and cylinder are coupled with high quality packing set.
- Compression platens are hardened over 55 HRC and rectified.

Available in the capacities: 2000 kN / 2000 kN blocks / 3000 kN / 3000 kN blocks / 4000 kN / 5000 kN
Load measuring system: Bourdon type gauge
"Digitec" or **"Cyber-Plus Evolution"** graphic display unit
Servo-controlled automatic system **"Autotec"** or **"Servo-Plus Evolution"** with optional "elastic modulus" determination.

Determination of the secant compression ELASTIC MODULUS on concrete System: Automatic with pace rate control also when releasing the load

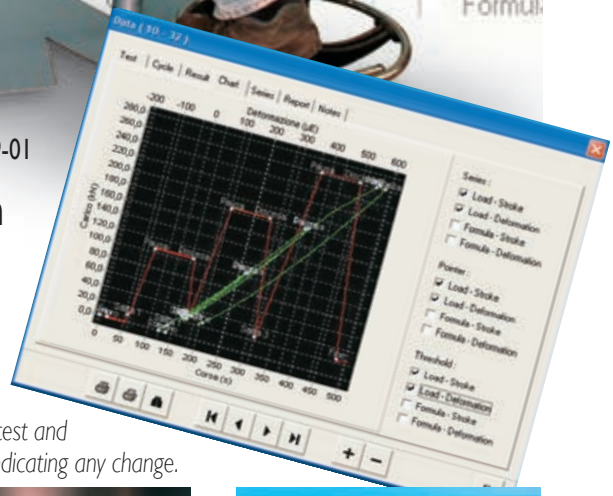
STANDARDS: **EN 12390-13** / ISO 1920-10:2010 / UNI 6556
ASTM C469 / DIN 1048

It can be used with a MATEST high stability frame with capacity of 2000 or 3000 or 5000 kN coupled to the automatic servo-controlled system "Servo-Plus Evolution" (mod. C104N) housed in a separate pyramidal frame.

The appliance includes:

- Hydraulic system
  It is an hydraulic installation and has a high performance valve directly controlled by the digital unit that grants the automatic control of the pace rate increasing the load, keeps a certain load and than **controls the pace rate decreasing the load**.
  The setting of the pace rate is made by a very sensitive valve controlled by a step by step motor and it allows a micrometric action on the pace rate granting excellent results.
  A laser position detector allows a rapid positioning of the piston. This grants a touching sensitivity of test starting of about 0,1 per thousand of the maximum capacity.

- Electronic measuring system
  The high performance control and data processing unit controlled by a 32 bit microprocessor, can manage up to 8 high resolution channels for the control of load cells or transducers with strain gages bridge.
  The unit contains two Analogical/Digital last generation converters with 24 bits resolution. The system processes the signals coming from the load cells and from the extensometers giving all the results required for a further processing following the most updated International Standards for this application.



Screen during a test and marker indicating any change.

C134

- Data acquisition and processing software UTM2 License for Elastic Modulus on Concrete.
  The software has been developed on the working line of the already known software UTM-2 (windows menu). It contains the profiles of the main Standards used, but the user can modify as he likes and personalise the test profile, that will be effected in a completely automatic way by the testing machine.

The user can introduce a list of data concerning the specimen that will be tested and the kind of test that he wants to make: shape of the specimen (cylinder-cube-block), dimensions, age of the specimen, average expected breaking value, etc… The appliance allows verifying the proper reading of the extensometers and, if everything is within the expected tolerances, it manages the average deformation value read by the transducers and processed by the digital unit, than it transmits by means of the communication port RJ (Network Connection) to a Personal Computer, that can be already by the end user or supplied separately all the data of the test. These data will be processed by the software and transformed in a graph load/deformation and load/time, following the International Standards.
The software allows to determine both the initial and stabilized secant modulus of elasticity as requested by EN 12390-13 Standard.
The software gives the possibility to print on a standard printer a test certificate reporting all the data concerning the test and the specimen and the graph of the test. The software includes the license "Servonet" mod. C123N, while the extensometers (two models are proposed: **A** and **B**) are not included in the standard supply and must be ordered separately (see accessory).

DETERMINATION OF THE SECANT COMPRESSION ELASTIC MODULUS TEST ON CONCRETE AND MORTAR SPECIMENS

C134
Electronic Universal EXTENSOMETER/COMPRESSOMETER

STANDARDS: ASTM C469 / ISO 6784 / BS 1881:121 / DIN 1048:1

Made of two anodized aluminium pieces, one fixed and the other sliding and housing a displacement transducer that measures with high accuracy the movement of two conical points made of hardened steel and fixed at the two ends of the electronic sensor.
An aluminium template (optional mod C134-10) is used to regulate and to calibrate the base length.
The two conical points are coupled to the surface of the sample with a rapid and simple fixing system through two elastic adjustable straps.
The instrument is equipped of a mechanical knob to lock and unlock the displacement transducer, allowing to maintain safe the selected base length during the fixing action of the device to the sample.
Normally the test is performed on cylinders by using 3 extensometers/compressometers, and on cubes or beams by using 2 or 4 instruments.
The extensometer is suitable to test cubes, cylinders and beam specimens, having minimum height of 130 mm.
It is also possible to test mortar prisms 40x40x160 mm by using a reducing length block.
Gauge length adjustable from 50 to 160 mm
Feeding up to 10 V
Travel: +/- 1,5 mm
Sensitivity less than 0,01 micron
Supplied complete with reducing block for mortar prisms, elastic straps, carrying case.
Weight: 1000 g approx.

UPGRADING OPTION: COMBINED TWO FRAMES GROUP

All motorized compression testing machines listed in the previous pages can be upgraded with an hydraulic two ways distribution block for connection and control (alternative, and non-simultaneous) to a second frame, like for example flexural frame or cement compression frame, with obvious functional and economic advantages (especially in the digital solutions).

A hydraulic two ways distribution valve may activate the standard frame or the second combined frame by utilizing only one hydraulic pressure source.

The load of the second combined frame is measured:
- For the gauges group with an additional specific gauge fixed on the second frame.
- For the digital group by utilizing one of the channels foreseen on the readout unit connected to the specific pressure transducer fixed on the second frame.

The additional combined frame is supplied complete with a hydraulic two way distribution valve, specific pressure transducer connected to one channel of the digital readout unit (or specific gauge), pipes, connectors, accessories, Matest calibration certificate.

The two frames group can be combined with many different solutions, according to the specific exigences of the customer, with the possibility to perform:

- COMPRESSION TESTS ON CONCRETE CUBE, CYLINDER AND BLOCK SAMPLES, by choosing the standard compression machine among our different available models from 1300kN to 5000kN capacity
- FLEXURAL TESTS ON CONCRETE BEAMS, FLAT BLOCKS, FLAGSTONES, KERBS, SLABS, TILES etc.
- COMPRESSION AND FLEXURE TESTS ON MORTAR SPECIMENS
- SPLITTING TENSILE TESTS ON CYLINDERS, BLOCK PAVERS, CONCRETE CUBES etc.

The composition of the combined group is obtained by:

C111-50

Distance piece

To be used with compression testers equipped with rectangular platens 510 x 320 mm to test blocks.
This device eliminates the heavy procedure to lift the lower rectangular platen and to add distance pieces to perform compression tests also on cube specimens.
This distance pieces is fixed over the lower rectangular platen through 4 adjustable couplers allowing a quick, correct and stable fixing.
On the distance piece it is now possible to put the round compression platen dia. 216 or 287 mm foreseen by the specific machine.
This distance piece is finish-grinded (suitable also for high stability testers), has dia. 210 mm, height 20 mm.
Weight: 3 kg approx.

Distance pieces

Used to reduce the vertical clearance between the compression platens, according to the height of the specimen to be tested, so to avoid the ram to make its max. excursion (approx. 50-55 mm) without having compressed the specimen.
The distance pieces are placed between the ram and the lower compression platen.

Standard load cells

TO BE USED WITH THE C138N DIGITAL INDICATOR FOR CALIBRATION OF TESTING MACHINES

STANDARDS: **EN ISO 376 / EN 10002-3 Class 2 /** ASTM E74 Class A

These load cells are suitable for the calibration of compression testing machines. They consist of a high quality steel block, named sensitive element, where some strains have been fitted: the whole is housed in a stainless steel sheathing. While the load is applied, strains are transmitted to an amplifier (mod C138N) which gives a load digital reading. Further advantages is the possibility to equip different load cells on the same measuring tester and therefore to check all load capacities. Supplied complete with Matest calibration certificate. PLASTIC CUBE, CYLINDER AND BEAM MOULDS

These one-piece moulds, very appreciated by the user, are made from hard plastic, strong, light, undeformable; resistant to vibrations shocks and wear. They do not require mounting and dismounting operations, thus saving time and labour. They just require a simple clean and demould oiling before being ready for use again for many times. The specimen is expelled from the mould by compressed air or water.

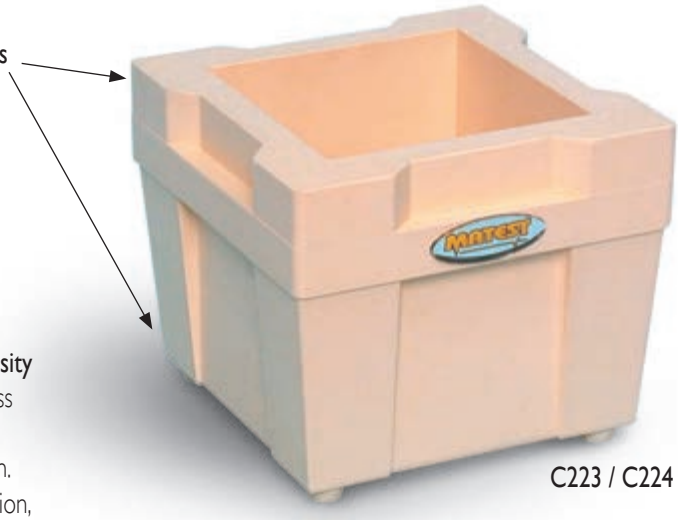
The moulds: C223, C224, C230N, C232N, C228, C229 are produced by Matest and have competitive manufacturer prices.

CUBE MOULDS 150 MM SIDE

The cube moulds 150 mm side can be supplied in three different models, each one with different characteristics and weight.
All the 3 models have a reinforced band on the walls, and the inside surfaces are very smoothed getting easier the specimen's ejection.
Models C223 and C224, Matest made, have also **"reinforced corners"**, granting an additional resistance, and foresee a **"X" reinforced band on the base**, improving the strenght of the mould, and allowing the user to give small blows with a rubber heated hammer (mod.V195) by easing the specimen's ejection. All the moulds are supplied with engraved the logo Matest.
All the moulds are also available unbranded, and on request they can be supplied with engraved the "customer's logo"

MODELS:

Reinforced corners



C223 / C224

UNBONDED CAPPING PADS AND RETAINERS

STANDARD: ASTM C1231

Used for compression tests on concrete cylinder specimens, as an alternative method to the sulphur capping and grinding machine.
Two steel capping retainers are applied on the two flat surfaces of the cylinder.
Two neoprene pads are put between them, for a better load distribution.
The neoprene pads are available in two models:
- 60 shore hardness pads for expected strength from 10 to 48 MPa
- 70 shore hardness pads for expected strength over 48 MPa

The system is not applicable for expected strength lower than 10 Mpa
The couple of retainers + neoprene pads have a total thickness of 46 mm. Therefore the testing chamber of the press must have more vertical clearance than the height of the specimen + 46 mm.

FLAT JACKS. Tests on brickworks

Determination of the resistance and deformation under load
Evaluation of the tensile stress
Measurement of the elastic modulus and breaking load

The complete test is developed in two steps:

DETERMINATION OF THE STATIC LOAD (TENSILE STATUS)
One flat jack is used.
Two datum points are fixed across a mortar joint and the distance between the points is measured.
Successively a horizontal cut is carried out with the suitable tool (drill, cutting saw) level with the mortar layer, and it is measured the variation of the two datum points.
The flat jack must be introduced, it is pressurized in different growing phases and the variation between the datum points is measured, by determining the static load.

DETERMINATION OF THE DEFORMATION AND RESISTANCE (IN-SITU STRESS)
Two flat jacks are used.
It must be done a second cut, parallel to the first one, level with the mortar layer, having a distance of approximately 50 cm from the first cut.
Another flat jack must be introduced.
Three couples of datum points are placed on the brickwork portion between the two cuts.
Start to pressurize the two flat jacks at growing phases.
The variation of distances of the datum points at different pressure steps allows to delineate a strength-deformation curve, obtaining elastic modulus, Poisson and breaking point values.

C375-10 KIT

Air and water permeability of concrete

FIGG TECHNIQUE

The ingress of air and moisture into the concrete can cause corrosion of the steel reinforcement and lead to a deterioration in concrete strength.
Therefore, a measure of the ease of movement of liquids and gases through the surface layer of the concrete is a better method of assessing the soundness and expected life of concrete than strength alone.
Permeability is recognized as being the most important parameter in assessing concrete durability.
The depth test is performed by drilling a hole 10 mm diameter x 40 mm deep, and plugged with a silicone rubber plug.
An hypodermic needle is passed into the stopper; the water permeability test is performed by measuring the time of absorption needed by the water introduced into the void by pressure.
For the air permeability test, a vacuum pressure is created in the void, and the time needed to rise this pressure is measured.
Surface permeability tests can be carried out by clamping a stainless steel chamber on the smooth surface of the concrete.

Combined ultrasonic and rebound hammer determination (sonreb method):

The C372N ultrasonic tester houses an integral data logger for data acquisition, processing and store of rebound hammer values.
The acquisition of the rebound values is performed with manual or automatic mode.

a) Manual mode:
Rebound values measured with a standard concrete hammer are manually input into the ultrasonic Tester.

b) Automatic mode:
The digital Matest test hammer mod C386N is directly connected to the ultrasonic tester through a cable. The measured rebound values are automatically transmitted to the C372N tester.

The measures of the velocity of ultrasonic pulses and the rebound values are automatically stored and processed, giving estimates of dynamic modulus of elasticity and Poisson's Ratio, and providing informations on possible voids, cracks and strength of the structure.
Through mathematical formulas it is possible to evaluate the compressive strength of the concrete, useful to estimate formwork striking times.
The combined test allow to rectify different inaccuracies that are typical of the simple rebound hammer test, and obtaining estimates on the compressive strength of the concrete, that cannot be obtained with the ultrasonic test, granting high accuracy and reliability of the results.

Resonance frequency meter

FOR THE DETERMINATION OF THE RESONANT FREQUENCY OF CONCRETE

STANDARDS: ASTM C215, C666 / BS 1881:209 / NF P18-414
UNI 9771

The unit measures the resonant frequencies of the three different modes of vibration:
- Longitudinal, transverse (flexural) and torsional.

From these, the following material characteristics, non destructively, can be calculated:
- young's modulus of elasticity,
- modulus of rigidity, and
- poisson's ratio.

Available for specimen sizes up to 150 mm cross section dimension, and from 45 mm to 700 mm in length.
Automatic identification of the resonance frequency. Large easy to view display for data analysis of time domain and frequency spectrum signals.
Data can be stored and uploaded to a PC for further analysis and inclusion in report.
Fast and easy to use system.
The principle used in this meter is based upon the determination of the fundamental resonant frequency of vibration of a specimen generated by an impact and sensed by an accelerometer. The frequency spectrum is computed and displayed by the meter.

Durability of concrete:
The determination of flexural resonance is very important when studying the degradation of concrete under accelerated freezing and thawing cycles and aggressive environments on concrete specimens.
The advantages of resonance methods are:
- Test can be repeated over a very long period on the same specimen; the number of test specimens required is therefore greatly reduced.
- The results obtained with the resonance method on the same specimen are more reproducible than those obtained with non destructive tests and groups of specimens.

Specifications:
- Frequency range: 10 Hz to 20 kHz
- Sampling rate: 20 kHz or 40 kHz
- Accelerometer sensitivity: 9.60 mV/g (0.979 mV/ms2)

Windsor HP probe digital system

STANDARDS: ASTM C803 / BS 1881:207 / ACI 347

To evaluate the compressive strength of concrete in place with the penetration method. Non destructive test. It is fast, accurate and simple to perform. The five-minute test does not weaken the structure. Comparison between test results using this method and destructive tests shows a variance normally within 3% from each other. The method requires a pistol-like device which is loaded with a small explosive charge and metal probe. The charge is precisely measured to give a consistent firing force. By pulling the trigger the probe is fired into the concrete.

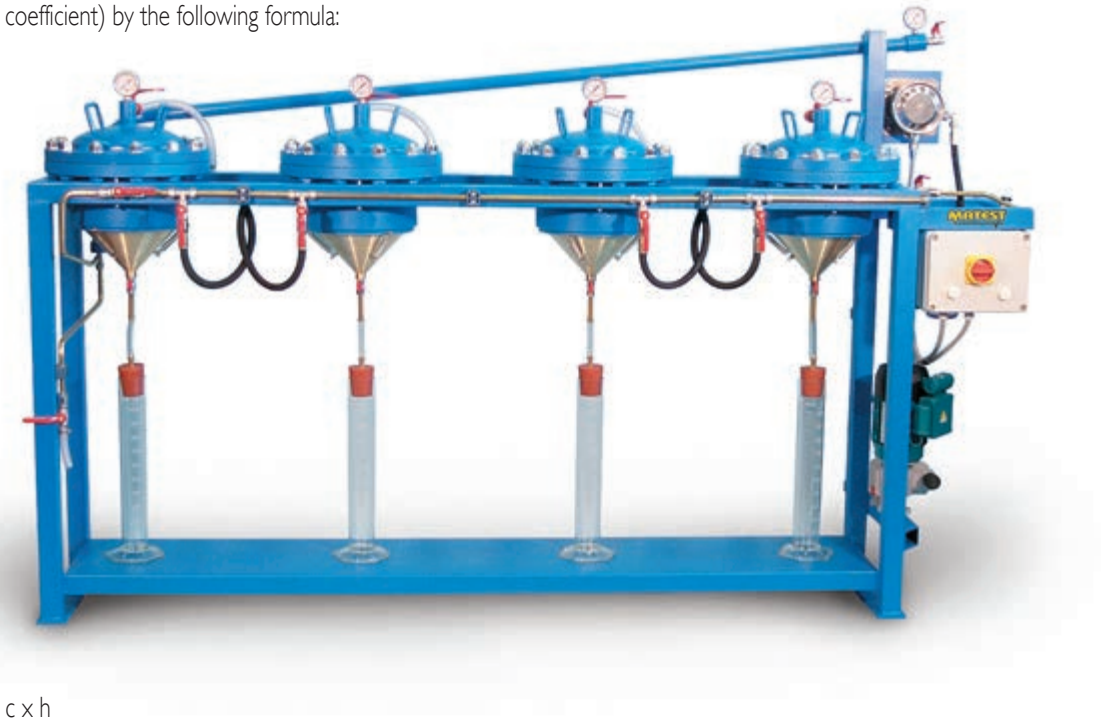
Automatic concrete water permeability apparatus at four cells

This fully automatic apparatus is designed to perform water permeability tests on cubic concrete specimens max. 150 mm side and cylinder specimens max. 160 mm diameter. The specimens are submitted to hydrostatic stress for a pre-set period. The water permeated through the test specimen is directly collected and measured into a graduated cylinder.
It is therefore possible to determine the permeability coefficient in cm/sec. (Darcy coefficient) by the following formula:



C430

$$K = \frac{c\,c \times h}{A \times t \times P}$$

where: cc = permeated water in cm^3
h = height of the specimen (cm)
A = surface area of the specimen (sq. cm.)
t = time to permeate (sec.)
P = hydrostatic pressure in cm. of water column

The equipment consists of a strong metallic frame holding four cells which are hot-galvanized for anti-corrosion protection.
Each cell includes a pressure control manometer.
A re-chargeable compensation plenum chamber is included as part of the test.
The pressure is adjustable from 0 to 30 bar and it is supplied by an automatic pump of variable supply, to achieve the most suitable installation for the specimen under test.
Water feed is direct from water inlet.
Seal pressure obtained through special and practical seal devices which maintain and simplify the use of the machine.
It is possible to use one or more cells together, and specimens also of different size (cubes/cylinders).
The specimen's sealing system is achieved through a practical and speedy, user-friendly device.

Supplied complete with four cells, four graduated cylinders, epoxy resin and accessories. The **"sealing devices are not included"** in the standard package and must be ordered separately.

Section E
CEMENT - MORTAR

The raw materials like: limestone, chalk, shale, clay etc., mixed with water, are crushed, ground and blended. They are now submitted to a chemical process in a rotary kiln until they combine into clinker. From the clinker opportunely mixed with gypsum, the cement factories obtain the modern Portland cement, that may be modified in more and more sophisticated binders like expansive mortars, pre-mixed cements etc.

In section "Cement & Mortars" Matest proposes a complete range of equipment for:

Fineness, Consistency, Setting-time, Workability, Soundness, Flow, Fly Ash, Lime reactivity and Slaking, Chemical Tests etc.; and for Mixing, Moulding, Curing and Strength Tests, to satisfy all the above quality variables, in compliance with the EN, ASTM and the most known International Standards.

VICATRONIC
AUTOMATIC COMPUTERISED TROPICALIZED VICAT RECORDING APPARATUS

STANDARDS: **EN 196-3:2005 / EN 13279-2 (gypsum) / EN 480-2** / ASTM C187, C191 / DIN 1168, 1196 / BS 4550 / UNE 80102 NF P15-414, P15-431 / AASHTO T129, T131

The Vicatronic apparatus, that is designed and manufactured using the most recent and sophisticated technology, is used for the initial and final setting time determination of cements or mortar pastes.
The unit is manufactured with **"anticorrosion and tropicalised"** components to be used in places with humidity not below 90% and 20°C. controlled temperature as required by EN Specifications.
The entire test is made in a fully automatic way and gives a very precise and repeatable result. The results are printed on the incorporated printer and this eliminates the manual operations of installing and zeroing the paper graph on the drum.
The use of the appliance is extremely simplified by the guiding menu that is available in english, french, spanish, german, polish, italian language.

DISPLAY
The large high contrast LCD display (negative blue) has a high resolution and shows the test data together with the general functions of the appliance. It visualises for the first time in real time the graph of the test (see picture) replacing and simulating what the old fashioned pen tracing on the paper. The appliance has a clock calendar that is used to program the test cycles.

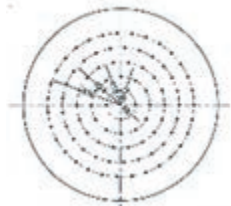
E044-45

E044N

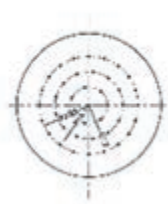
FIRMWARE
The Vicatronic is supplied with the standard programs to make automatically, all the tests according to the following Standards:
EN 196-3:2005 / EN 13279-2 gypsum / EN 480-2 / ASTM C191
DIN 1164 / DIN 1168 gypsum / NF P15/431 / BS 4550 / AASHTO T131

Further programs can be developed by the operator using the specific menu "free tests" available on the base firmware; the user has the possibility to set 5 totally free test profiles defining the number of penetrations and the coordinates of each penetration (ray in mm of the circle where the number of penetrations have to be distributed) and number of circles. This possibility is particularly useful when testing new mortars, additives and to make research tests that requires sophisticated and flexible applications.

90 penetrations program



ASTM



EN

TIMER 0 – 999 MINUTES

The firmware allows activating a delay on the appliance to the beginning of the test. This program is particularly useful when the approximate setting time of the mortar is known and the operator wants to start the working of the Vicatronic after a certain time in order to concentrate the penetrations with a short interval of time between them and have better measuring values.

PROBES

The mobile probe weighs 300 g (1000 g following the EN, NF Standards), the penetration needle has 1,13 mm diameter (1 mm following ASTM Standard) and its fall can be programmed in free fall or in guided fall. Totally flexible as far as the time is concerned, the penetrations time can be selected between 0,5 minutes and 999 minutes (fix interval between two penetrations of a test) or can change during the test up to 5 different phases with different interval time; it can even change automatically during the setting time fixing a penetration depth. The two options described here above can be combined together.

The penetration measure is read by a very accurate encoder having a resolution of 0,1 mm.

The Vicatronic also calculates, visualises and prints:

- The time from the moment of the sample preparation (set by the operator).
- The time the test starts.
- The residual time to the next penetration.
- The residual time to the end of the test
- The number of penetrations made and the residual penetrations to be made.

TEST RESULTS

The Vicatronic can memorise all the test parameters and results and keeps a file with a capacity of more than 50 complete tests.

In case of a power cut, even a short one, during the test execution, the test will be invalidated and the appliance will be automatically stop keeping the set data.

At the end of the test the appliance will print automatically by the incorporated printer a report with all the data concerning the last test made including a graph tracing each single penetration with its values of time and penetration number (see example printed).

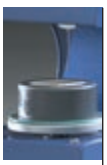
PRINTING EXAMPLE



PC CONNECTION AND NET OPTIONS

Despite the totally independent working of the machine that includes an incorporated printer, the Vicatronic has been designed for a PC connection (RS232) with the possibility to download the test data using a common program (Microsoft Hyper Terminal) that is normally incorporated with the Windows package of the PC. In this case the data processing will have to be made by the operator.

The **"Vicat-Win"** software (accessory mod. E044-11) allows receiving, managing, processing and completing the test dates; it will trace automatically the graph, personalise and print the test report.

The Vicatronic offers the possibility, buying the kit **"Vicat-Net"** (accessory mod. E044-12), to connect up to 20 appliances on a net managed by a PC through two pins RJ45 with RS485 protocol. This allows obtaining a complete remote control from the PC of each single Vicatronic.

The details of the performances are following:

- Transfer each single control or function of the Vicatronic on the PC
- Verify in real time each phase of the test being made.
- Automatically download the final results at the end of the test on all the connected Vicatronic.
- Process and file at the same time all the tests without obliging the operator to move from his working place.

Additionally the firmware has many other functions detailed in the technical chart that will be transmitted to the user interested to know more about it.

The Vicatronic is supplied complete with the incorporated printer, two hardened needles (one with 1 mm diameter and one with 1,13 mm. diameter), two conical moulds EN and ASTM, a glass plate to hold the conical mould.
Power supply: 230 V 1 Ph 50/60 Hz. 50W
Dimensions: 400 x 200 xh 470 mm. h.
Weight: 13 kg.

Automatic recording penetrometer "Italcementi model" *

Used for determining the initial and final setting time of hydraulic binders.
This instrument automatically measures and records the time needed by a cement paste to reach a pre-established consistency degree.
The setting of the specimen is measured in static conditions; it is continuously and automatically recorded on a diagram allowing an accurate and uniform determination of the initial, intermediate and final hardening process.
The operator obtains a graph with the results of each tested specimen, accurately showing the progressive increasing of the consistency-time ratio (consistogram).
The instrument automatically cut-off at the end of the test.

COMPRESSION AND FLEXURAL TESTING MACHINE "HIGH PERFORMANCE" WITH DUAL TESTING CHAMBER AND TWO INDEPENDENT MEASURING RANGES 300 kN AND 15 kN WITH LOAD CELLS

Cyber-Plus or Servo-Plus Evolution Touch Screen Digital System

STANDARDS: **EN 196-1** / EN ISO 679 / ASTM C109, C348, C349 / NF P18-411, P15-451 / UNE 80101
DIN 1164 / BS 3892, 4550, 4551

This testing machine of high performance, advanced solutions and top quality components is equipped with two load chambers with two independent measuring ranges. It is suitable to perform:

- Flexural tests on cement prisms 40,1x40x160 mm (with the range 0 - 15 kN)
- Compression tests on portions of prism 40,1x40x160 mm broken in flexure, cubes side 40, 50, 70, 100 mm 2", cores with max. height of 180 mm (with the range 0 - 300 kN)

by using the suitable compression devices described in next pages (accessories E170 - E172-01)

The applied load is measured by two strain gage load cells (15kN and 300 kN) at high accuracy.

This solution eliminates the weights of the piston and lower compression platen, packing set frictions etc., granting very high accuracy (max. error within +/- 0,5%)

The load chamber 0 - 15 kN permits very accurate tests on specimens having low strength (both in compression and in flexure).

- Max. vertical daylight between platens: 189 mm
- Platens diameter: 165 mm
- Ram travel: 35 mm approx.

E190N

Determination of MODULUS OF ELASTICITY in compression of products and systems for the protection and repair of concrete structures (Mortars) System: Automatic with pace rate control also when releasing the load

STANDARD : **EN 13412**

It can be used with a MATEST testing machine to be selected among the Servo-Plus Evolution models (ref. C104N, see pag. 158).

The appliance includes:

- Hydraulic system
  It is an hydraulic installation and has a high performance valve directly controlled by the digital unit that grants the automatic control of the pace rate increasing the load, keeps a certain load and than controls the pace rate decreasing the load.
  The setting of the pace rate is made by a very sensitive valve controlled by a step by step motor and it allows a micrometric action on the pace rate granting excellent results.
  A laser position detector allows a rapid positioning of the piston. This grants a touching sensitivity of test starting of about 0,1 per thousand of the maximum capacity.

- Electronic measuring system
  The high performance control and data processing unit controlled by a 32 bit microprocessor, can manage up to 8 high resolution channels for the control of load cells or transducers with strain gages bridge.

C134

The unit contains two Analogical/Digital last generation converters with 24 bits resolution. The system processes the signals coming from the load cells and from the extensometers giving all the results required for a further processing following the most updated International Standards for this application.

- Data acquisition and processing software UTM2
  License for Elastic Modulus to EN 13412.

  The software has been developed on the working line of the already known software UTM-2 (windows menu). It contains the profiles of the main Standards used, but the user can modify as he likes and personalise the test profile, that will be effected in a completely automatic way by the testing machine.

The user can introduce a list of dates concerning the specimen that will be tested and the kind of test that he wants to make: shape of the specimen, dimensions, age of the specimen, average expected breaking value, etc… The appliance allows verifying the proper reading of the extensometers and, if everything is within the expected tolerances, it manages the average deformation value read by the transducers and processed by the digital unit, than it transmits by means of the serial communication port RJ (Network Connection) to a Personal Computer, that can be already by the end user or supplied separately (not included with the Software), all the dates of the test. These dates will be processed by the software and transformed in a graph load/deformation and load/time, following the International Standards.

The software gives the possibility to print on a standard printer a test certificate reporting all the dates concerning the test and the specimen and the graph of the test. The Software includes the license "Servonet" mod. C123N while the extensometers (two models are proposed: A and B) are not included in the standard supply, and must be ordered separately (see accessories).

NOTE:
The Elastic Modulus on Mortars mod. E190N can be used together with:

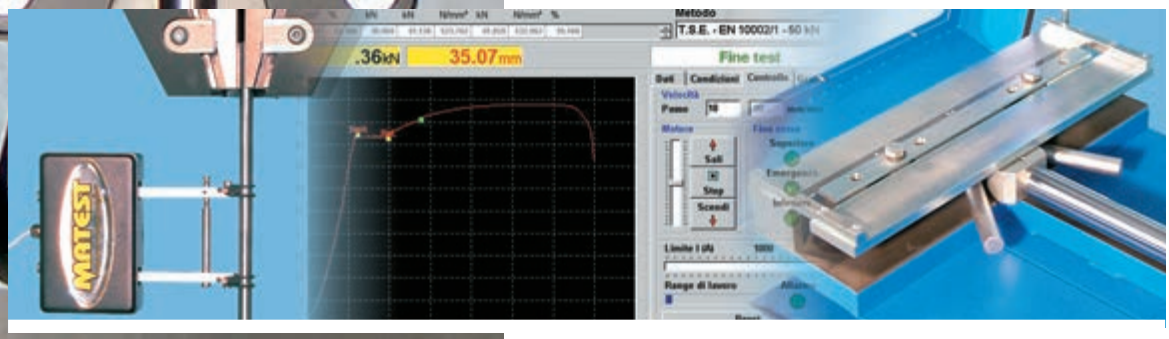
This range of machines satisfies both control tests on steel bars for reinforced concrete, and quality tests in the iron metallurgy, metals, plastics etc.



H003N

Universal hydraulic servo-controlled machine 600 kN capacity *with Touch-Screen Servo-Plus Evolution* digital system, to perform static tensile tests on metallic materials.

STANDARDS: **EN 10002 / EN ISO 6892, 7500-1** / ASTM A370

It basically consists of:

- Strong loading frame with a reading cell built into the piston
- Hydraulic Servo-Plus Evolution Touch-Screen system (technical details: see pag. 130; firmware details: see pag. 24), for the data acquisition, control and processing. The whole is built in a console.

Servo-controlled electromechanical universal testing machine

This appliance is designed to be used in Laboratories for Quality Control and Research on Metals, Plastics, Composed Materials, Wires, Ropes, Paper, Textiles etc.
The machine is suitable to make tensile and elongation tests on different materials following the **EN 10002 / EN ISO 6892, 7500-1** ASTM A370 Standards.

The machine is composed by a strong base containing the transmission components and the Hardware control instruments.
The base carries two columns that guide the cross-bar; they are made of high resistance steel with ground hard chrome surfacing.
The big diameter and the position where the columns are fitted grant a high lateral rigidity. The system is suitable to realise both tests with single direction or dual direction.
In order to grant no clearance, the transmission of the movement to the mobile cross-bar takes place through two re-circulating spheres screws with pre-loaded female screws.
High attention is given to the assembling system of the screws and their groups - bearings put in the base and in the upper head.
The mobile cross-bar with big section together with all other elements of the machine being properly dimensioned grant a very good "Rigidity of the machine" (see UNI ISO 5893 Standards).
The moving up and down of the cross bar on the columns happens through sintered bushes with low friction coefficient.
On the mobile cross-bar there are some holes for the mounting of the load cells.

The Load Cell is made in stainless steel and reads both tensile and compression loads with a very high precision.
It is in conformity with the **EN 10002-2 / EN ISO 6892, 7500-1** Standards.
Features of the load cell referred to ISO 376 Standards.

Accuracy class	1
Repeatability error	≤ ± 0.145%
Interpolation error	≤ ± 0.090 %
Error on zero	≤ ± 0.03 %
Reversibility error	≤ ± 0.240%
Non linearity error	≤ ± 0.04 %
Maximum overload capacity	200%

In order to follow the specific needs of each single application, different load cells with different capacities within the nominal capacity of the machine can be installed on the frame.
Different connections for the installation of the seizing devices are on the mobile cross-bar and on the base (see accessories at following pages).
The machine is delivered with different safety devices limiting the maximum travel of the cross-bar. There is also an adjustable device that allows setting a personalised upper and lower travel limit following the used appliances.

The control section is made by a series of cards inside the base of the machine that are managing the control units and the reading units positioned on the machine.
The acquisition card, with a powerful microprocessor and converter AD 24 bits, takes all the working dates and through a RS232 connection it sends all these dates to the Personal Computer, which controls all the functions of the machine and makes the elaboration of all the calculations through the program UTM2.

On the base there are:
A device which allows an easy and speedy positioning of the mobile cross-bar. A push button to interrupt the test execution at any time. A series of connectors for the connection to the control PC and to the auxiliaries appliances (extensometer, load cells etc.)
General switch/Safety switch.

ACCESSORIES FOR MOD. H003N, H002N and from MOD. H004 to H008:

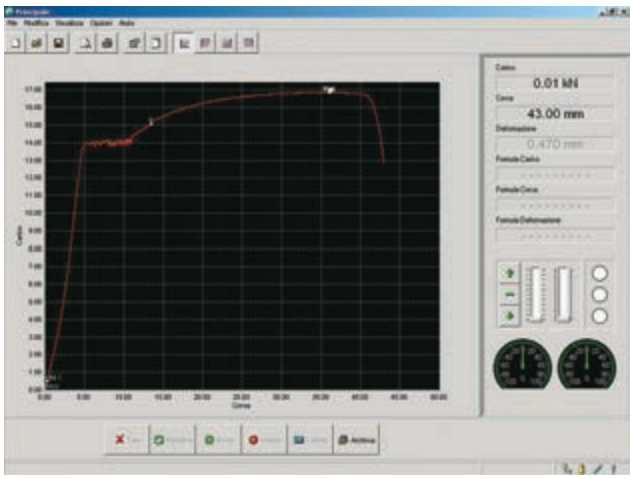
UTM2 SOFTWARE

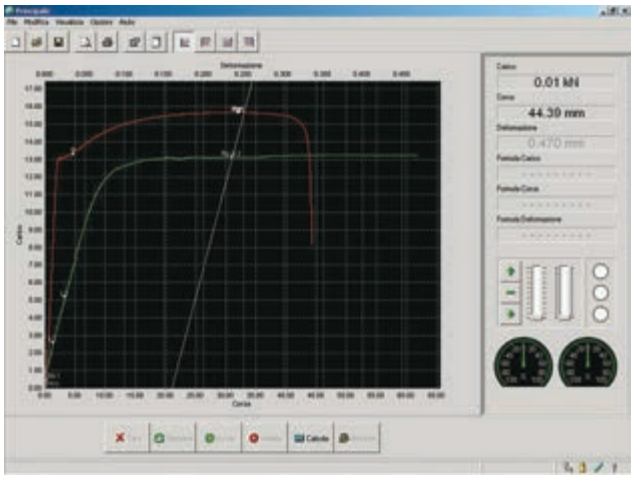
STANDARDS: **EN 10002-1** / ISO 527, 178, 604, 898-1, 3506-1, 10113, 12275 / ASTM A370

This Software, that has been developed following the UTM2, has been realised following the way of working of Microsoft windows operating system.
The software has been conceived realised in an interactive way and is the ideal solution for an effective and complete management of the material testing.
It is composed by many test procedures in conformity with the International Standards for metal, plastic, cement, wood and composed materials.



Tensile test on a steel specimen without extensometer; it visualises the starting of the specimen breaking with the possibility to increase the dimensions of the area of the graph by means of the zoom function.

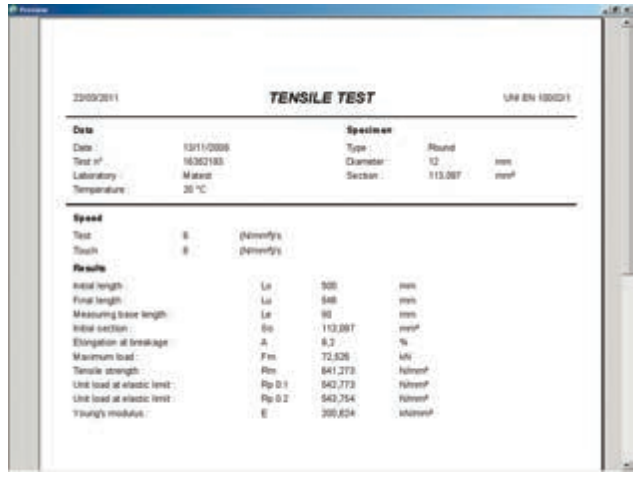
The conception of this software supports a wide range of calculation needs and tensile, compression, flexure test profiles.
The user can realise new personalised test profiles: definition of the test data as the date of the test, the certificate number, the lot of the material delivered, the origin of the specimen, the test temperature… and definition of the specific dates of the specimen as type, dimensions measuring unit…



Tensile test on a steel specimen using tan extensometer, showing the symbols of the considered dimensions and the relative tracing in different colours selectable by the user.

The user can select and set the calculation corresponding to the activated standard. As an example for the Standard EN 10002/1 he can select the initial length, the initial section of the specimen, the calculation of the maximum load, the unit load, the elastic limits (ReH, ReL, Rp%), the restriction, the Young's Modulus….
For some calculations the end user can set the test execution parameters corresponding to the calculation algorithms as an example for the deviation of the Rp proportionality he can introduce the percentage %.

The software allows a speedy and easy management of all the machine parameters as the management of the load acquisition by means of a load cell, the specimen deformations by means of an extensometer and the crossbar displacement. For each one of the analogical channels the user can set the calibration and visualisation measuring unit, the limits of use: alarm, value of starting of the test calculation….
The test setting happens by dividing the process in different phases or speed charts, for each one of these charts the user can set the required kind of control (pace rate, load/time, deformation/time), the tare and the zero option , the limits and the phase or speed changes.
The end of test mode or the breaking limit can also be selected.
The software allows personalising and setting the visualising parameters of the test graph as the colour, the title of the Cartesian axis, the colours of the load/deformation limits and the certificate parameters as titles, margins….



Example of test certificate

At the end of the test the user can decide if the selected calculations must be effected and/or if he wants to save the test in the file. In any moment all the tests made are available to make an analysis of the results or to print their certificate.
Graphic analysis of the test can be made by means of the zoom function.

H065N

ACCESSORY:

H065-01
Safety guards to CE Safety Directives.

This equipment has been studied and designed to perform bending tests on steel bars for reinforced concrete.
The test consists in bending the bar at 180° or to bend the same at 90° and then straighten if of at least 20°.
This bending machine is composed of a rugged frame supporting a beam having a cylinder with relevant load piston fixed on it, being activated by an hydraulic cell complete with speed adjuster for the piston, direction control valve, max. pressure valve, control gauge.
The whole is cased to protect every single component from the dust, and the operator from any possible danger. A small bowl has been fitted under the beam, where the steel bar is bent.
Two contrasting rollers are fitted on the beam. They may easily be adjusted in distance to be in accordance with the Standards concerning bars having diameter between 5 and 40 mm.
Fixing and changing the mandrels on top of the thrust cylinder is easy and practical and grants the operator a perfect interchange-ability of the same. A device prevents the unlocking of the bar under test from the relevant rollers and the contrasting mandrel both during the bending and the straightening operation.
The machine accepts bars up to Ø 40 mm. and is supplied complete with two series of rollers, having respectively Ø mm. 50 and 100. The mandrels, the mandrel-holders and the brackets are not included in the standard supply and have to be ordered separately. (see table).

Automatic, programmable PROCTOR / CBR Compactor with microprocessor, "high technology"

STANDARDS: **EN 13286-47** / ASTM D698, D1557, D1883 / AASHTO T99, T180, T193 / BS 1377:4, 1990, 1994 / NF P94-093, P94-066 DIN 18127 / UNE 7365, 7255, 103-501-94 / CNR UNI 10009 / CNR N. 29, 69 / DUTCH RAW / AS 1289 and most International Standards.

Designed to compact Proctor and CBR specimens, it ensures an extremely uniform compaction degree, granting reliable and repeatable test results.

The microprocessor software allows to select and to perform different compaction cycles in a fully automatic system, by strictly meeting the mentioned International Standards.

The blows are automatically distributed as requested by the selected Standard, with turntable rotation and rammer displacement through photoelectric cell sensors and microprocessor. Top quality components and high accuracy mechanical workings grant very long life also under intensive utilisations.

The digital control panel is separate from the machine and it can be fixed to the wall or mounted on a bench.
The high resolution graphic display (blue negative) 320x240 pixels visualizes selected Standard, total number of blows, effected and remaining ones to end the test, and execution of each layer.

The compactor is easy to use, friendly menu driven, of simple and practical maintenance.

The user can **"select and memorize up to 10 personalized test cycles"**, that can be later on modified or replaced by other ones. This is a very important function, because it allows to update the Compactor to new Standards, or any Standard not included in the microprocessor, or for research purposes.

The original lift system of the rammer can be selected at 12" or 18", or at 300 or 450 mm, granting a correct and constant fall height.
Rammer drop speed: 1 blow each 2 seconds.

UNITRONIC 200kN "Matest made"

UNIVERSAL ELECTROMECHANICAL FRAME, 200KN CAPACITY, "TOUCH-SCREEN" FOR:
- COMPRESSION
- FLEXURE
- TENSILE

TESTS OF CONSTRUCTION MATERIALS WITH SERVO-CONTROLLED SYSTEM OF LOAD OR DISPLACEMENT/STRAIN.

Unitronic 200kN is the universal and versatile machine fully satisfying the needs of control, research and university laboratories to carry out tests on:
Roads (Marshall, Duriez, CBR etc.), Steel, Concrete, Cement, Wood, Plastic, etc.
The machine is composed by a sturdy base containing the transmission components and the hardware control instruments.
The base holds two columns, made of high resistance steel with ground hard chrome surfacing.
The upper crosshead can be adjusted in height, to hold the accessories to perform the specific tests.
The lower mobile crosshead is operated by a recirculating ball screw and rotating lead, that through a servo-controlled motor, assures the correct application of load and constant speed.
The load is applied by a mechanical jack activated by a **"brushless closed-loop motor with optical encoder"** controlled by a microprocessor.
The two crossheads foresee couplings to fix the different test devices (see accessories).
The stress is measured by an electric load cell; the measurement and the displacement control of the crosshead is achieved by the electronic device incorporated into the machine.
Stroke electric end excursion switches of the upper mobile crosshead are foreseen to save the machine from accidental handlings.

Firmware:
- Electronic control unit "Cyber-plus Evolution" with Touch-Screen colour display, that runs like a standard PC based on Windows operating system for the management and analysis of the data, test results, graphs.
- The Touch-Screen icon interface allows an easy set up of the parameters and immediate execution of the test.
- The machine can be connected to a PC for remote test execution through suitable Software; the machine can in any case perform the tests without any external PC, because of the "Cyber-Plus" grants performances like a PC.
- Direct connection to Intranet (connection to a LAN network) and Internet to establish a remote communication and receive an immediate diagnostic analysis from Matest technicians, or for uptdates of the software.
- Unlimited memory storage with: 2 USB ports, 1 SD card slot, RS232/485 serial port.
- Possibility to select different languages.
- Hardware technical details: see pag. 24

Software OedoLab Reports - Matest made

NEW

STANDARDS: ASTM D2435-80 / XP P94-090-1 / CEN-ISO-TS 17892-5 / BS 1377:5

OedoLab Reports is the new informatic tool which allows geotechnical laboratories to process data and to view the results obtained from oedometric tests.

Used in conjunction with Cyber-Plus S334, the new features of this software allow the users to:

- Create a test file from data entered manually or imported
- Create a project to perform calculations according to the selected standard
- Integrate test files (from OedoLab Connect or manually entered) to a project
- Elaborate, customize and print their test reports which can be read without the need of a specific software.

The program can be used in a very simple and intuitive way. A dedicated window allows the user to import data from a specific location (for instance, from the Cyberplus through USB or SD card).

OedoLab Reports provides the user with a simple and flexible graphical interface giving the possibility to view, edit and print all the parameters involved in the oedometric tests.

S260-05N Data feeding/acquisition

- The input information for each stress level is the following:

- Settlements in mm.
- Time in min.

- The Software allows also to enter information related to the soil sample, among which:

- Extraction method.
- Blue value.
- Attemberg's limits.
- Soil classification according to AASHTO/USCS/GTR.
- Particle size analysis.

- Laboratory coefficients of:

- Consolidation – root method.

S262N

EDOTRONIC *"TOUCH SCREEN HIGH PERFORMANCE"* AUTOMATIC CONSOLIDATION APPARATUS (OEDOMETER).

STANDARD: ASTM D2435-80 / CEN - ISO - TS 17892-5 / BS 1377:5 / XP P094-090-1

This automatic consolidation system, ideal for modern and efficient laboratories, has been created to eliminate or reduce to the absolute minimum any forms of manual intervention, which the oedometer test requires. This therefore results in greater efficiency and cost effectiveness. This appliance is extremely simple and easy to use.

Specifications of the frame:

Edotronic, equipped with two coaxial cylinders, provides a precise and timely weight positioning with two ranges of measurement:

0 – 1499 (N) Newton
1500 – 15000 (N) Newton

Input of compressed air (filtered):	Max. 10 Bar
Resolution:	1 Newton
Precision:	1%
Maximum load:	15 kN (with 8 Bar input)

There is no need of weights as the cylinder and pneumatic piston take it to the desired weight in real time.
Weight application and removal are carried out automatically in the test sequences.

The load value is measured by a pressure transducer which is built in the regulation valve.
An additional high precision load cell will detect the effective load value and perform precise control through a closed loop system, granting repeatability and accuracy.

Software OedoLab Connect – Matest made

STANDARD: ASTM D2435-80 / CEN - ISO - TS 17892-5 / XP P094-090-1 / BS 1377:5

To be used with the Edotronic mod. S262

OedoLab Connect is an extension of the OedoLab Reports S262-05N software, specifically designed to guide the user through the entire consolidation test.
This software allows automatic data acquisition and to save the results in a specific file.
Thus, the file obtained can be then added to a project created with OedoLab Reports, providing the users not only with the same features given by the S262-05N but also with new ones.

OedoLab Connect can be connected to one or more pneumatic oedometers, allowing automatic data acquisition and control during the test. Each oedometer is controlled by the PC via network connection.

OedoLab Connect provides the user with a simple and flexible graphical interface. A dedicated window allows to select the oedometer the user wants to work with.

Once a consolidation step is completed, the software automatically shifts to the next level; hence re-performing all the control and acquisition operations needed to complete the test. Furthermore, by setting test parameters which are included in the Software and dedicated to the loading sequences control (minimum speed of settlement and swelling threshold), the user is also able to program the test and save a lot of time then.

PC specification:

- Operating system: Windows XP or more recent.

Supplied complete with connection cable.

TRIAXIAL TESTS

STANDARDS: BS 1377 part 8 / ASTM D2850-032, D4767-95, D7181-11 / NF P94-070, P94-074 / CEN-ISO /TS 17892-8,9

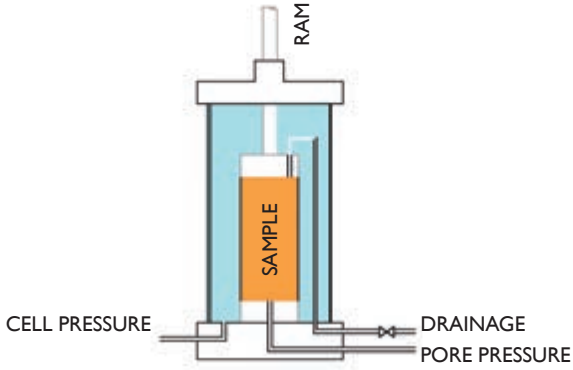
Introduction

A knowledge of stress-strain behaviour and the shear strength parameters of soils is required when soil is interacting with structures or when soil is used as a construction material in many engineering purposes such as:

1. Excavations
2. Shallow foundations
3. Piles and deep foundations
4. Earth retaining structures, diaphragm walls, anchors
5. Slope stability
6. Ground improvement
7. Design of embankments, earth dams

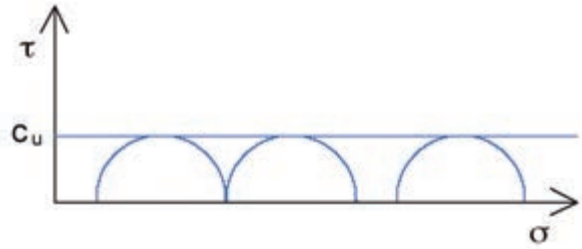
The most widely used testing apparatus for investigating the stress-strain behaviour and the strength parameters of soils is the triaxial apparatus.

Triaxial tests are typically performed with two stages: an isotropic loading followed by shear loading which is carried out up to failure. A cylindrical saturated soil sample, undisturbed or reconstituted, is placed in a rubber membrane in order to isolate it from direct contact with the surrounding water with which the testing cell is filled, and which is pressurized. The sample sits in the cell between a rigid base and a rigid top cap and is loaded by means of a ram, at a constant speed. The water drainage in or out the sample can be allowed by means of opening or closing a valve.
The two phases are carried out under different combinations of drainage conditions and give rise to 3 different standard triaxial tests. Each test is usually performed on three saturated specimens at three different confining pressures.



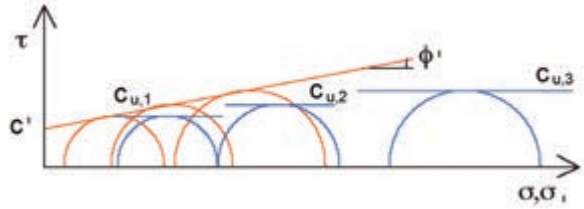
"UU" unconsolidated undrained test

This test is used in order to estimate the undrained shear strength parameters (undrained shear strength c_u and undrained friction angle $\phi_u = 0$). It is usually performed on fine grained soils. In this test, both phases are carried out with the drainage valve closed. No volume change is allowed during the test and distortions during the shear phase occur up to the failure. This test gives a unique value of undrained shear strength, as the envelope of the Mohr circles plotted in total stresses is horizontal. The angle ϕ_u has to be zero or it is an error in the test, e.g. poor saturation.
The stress-strain behaviour and the strength parameters are then used to model engineering problems when undrained conditions are present, typically in short term design.



"CU" consolidated undrained test

This test is used in order to estimate the drained and undrained shear strength parameters (effective cohesion c', effective friction angle ϕ', and undrained shear strength c_u). It is usually performed on fine grained soils. In this test, the first phase is carried out with an open drainage valve in order to allow the consolidation and volume change to occur. During the second phase, the drainage valve is closed and the change of pore water pressure is measured; there is no volume change and distortions occur up to failure. It gives three values of undrained shear strength, which are the radii of the Mohr's circles, and the values of the effective cohesion and of the effective friction angle, which are derived from the envelope of the effective stress Mohr's circles. The stress-strain behaviour and the strength parameters are then used to model engineering problems when undrained conditions are present, after consolidation processes or in long term applications.



"CD" consolidated drained test

This test is used in order to estimate the effective shear strength parameters (effective cohesion c', effective friction angle ϕ'). It is usually performed on coarse grained soils. In this test, both phases are carried out with the drainage valve open. Volume change occurs in both phases and during the second phase, distortions occur up to failure. The CD test gives the values of the effective cohesion and of the effective friction angle, which are derived from the envelope of effective stress Mohr's circles. The stress-strain behaviour and the strength parameters are then used to model engineering problems when drained conditions are present, typically in long term design.

Software TriaxLab Connect & Reports - Matest made

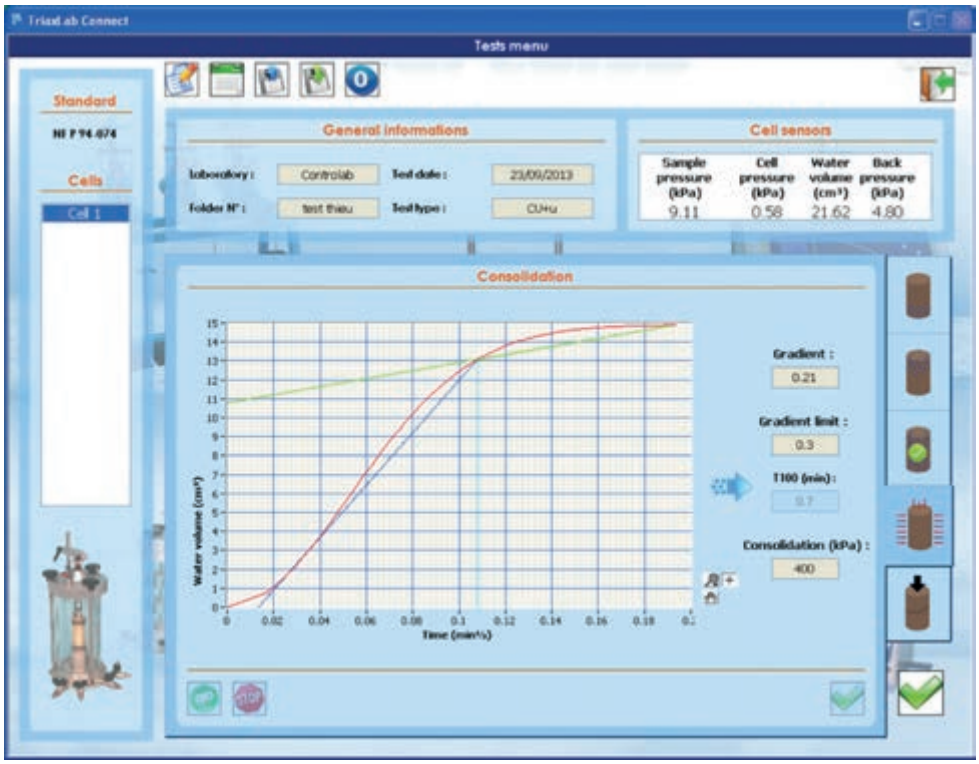
STANDARDS: NF P94-070, P94-074 / ASTM D2850-03a, D4767-95, D7181-11 / BS 1377:8

TriaxLab Connect is the new acquisition software for Matest triaxial systems. This software allows the user to:

- Configure the acquisition parameters necessary to conduct the test
- Perform all of the 3 steps of a triaxial test (saturation, consolidation and shearing)
- Calculate the t100 value used for the shearing speed
- Record data for each calculation step
- Save test data and test parameters

Hence, the files created by this software can be used in TriaxLab Reports to generate a report by selecting the dedicated Standards.

Both Connect and Reports programs can be used in a very simple and intuitive way. Thanks to a suitable window, TriaxLab Reports gives the opportunity to perform calculations for all triaxial tests (UU, CU+u or CD).



S335-10N Consolidation step in TriaxLab Connect

The software provides the user with a simple and flexible graphical interface, giving the possibility to view, edit and print all the parameters involved in triaxial tests.

• Laboratory coefficients of:
  - Saturation
  - Consolidation
  - Shearing

• CHARTS:
  - Water Volume (cm3) / Square-root Time (min)
  - Press Load (kN) / Press Displacement (mm)
  - Deviator Stress (kPa) / Axial Strain (%)
  - Pore Pressure (kPa) / Axial Strain (%)
  - Shear Stress (kPa) / Normal Stress (kPa)
  - Volume Deformation (%) / Axial Strain (%)
  - Stress t' (kPa) / Stress s' (kPa)
  - Effective Principal Stress Ratio / Axial Strain (%)

• PC specification:
  - Operating system: Windows XP or more recent
